European Technical Assessment

**ETA-14/0120
of 29/07/2024**

General Part

Technical Assessment Body issuing the European Technical Assessment

Instytut Techniki Budowlanej

Trade name of the construction product

Injection system VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T for rebar connections

Product family to which the construction product belongs

Post-installed rebar connections with injection mortar

Manufacturer

ALSAFIX S.A.S.
114a rue Principale
67240 Gries, France

Manufacturing plant

ALSAFIX S.A.S. Manufacturing plant 1

This European Technical Assessment contains

23 pages including 3 Annexes which form an integral part of this Assessment

This European Technical Assessment is issued in accordance with regulation (EU) No 305/2011, on the basis of

European Assessment Document (EAD) 330087-01-0601 "Systems for post-installed rebar connection with mortar"

This version replaces

ETA-14/0120 issued on 07/10/2019

This European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

Specific Part

1 Technical description of the product

The subject of this assessment are the post-installed connections, by anchoring or overlap connection joint of steel reinforcing bars (rebar) in existing structures made of normal weight concrete, using injection system VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T in accordance with the regulations for reinforced concrete construction.

Reinforcing bars made of steel with diameter from 8 to 32 mm and VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T injection mortars are used for the post-installed rebar connections. The steel element is placed into a drilled hole previously filled with an injection mortar and is anchored by the bond between embedded element, injection mortar and concrete.

An illustration and the description of the products are given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document (EAD)

The performances given in clause 3 are only valid if the post-installed rebar connections are used in the compliance with the specifications and conditions given in Annex B.

The provisions given in this European Technical Assessment are based on an assumed working life of the rebar connections of 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Performance of the product

3.1.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance under static and quasi static loading	See Annex C1
Characteristic resistance under seismic loading	See Annex C2

3.1.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Anchorage satisfy requirements for Class A1
Resistance to fire	See Annex C3

3.2 Methods used for the assessment

The assessment has been made in accordance with EAD 330087-01-0601.

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

According to Decision 96/582/EC of the European Commission the system 1 of assessment and verification of constancy of performance applies (see Annex V to regulation (EU) No 305/2011).

5 Technical details necessary for the implementation of the AVCP system, as provided in the applicable European Assessment Document (EAD)

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited in Instytut Techniki Budowlanej.

For type testing the results of the tests performed as part of the assessment for the European Technical Assessment shall be used unless there are changes in the production line or plant. In such cases the necessary type testing has to be agreed between Instytut Techniki Budowlanej and the notified body.

Issued in Warsaw on 29/07/2024 by Instytut Techniki Budowlanej

Deputy Director of ITB

Examples of post-installed rebar connections

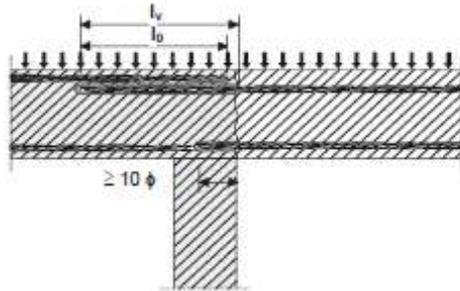

Figure 1.1 Overlap joint for rebar connections of slabs and beams

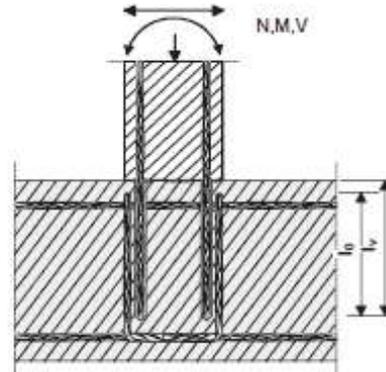

Figure 1.2 Overlap joint at a foundation of a column or wall where the rebar is stressed in tension

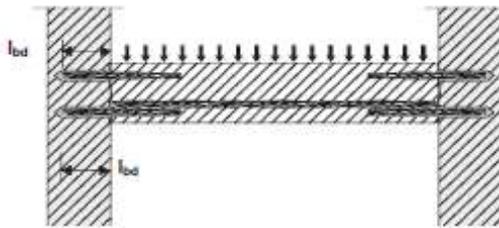

Figure 1.3 End anchoring of slabs or beams, designed as simply supported

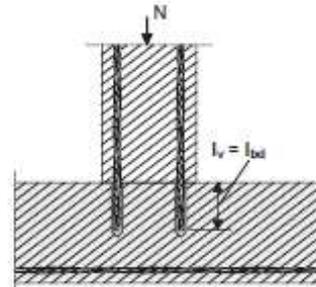

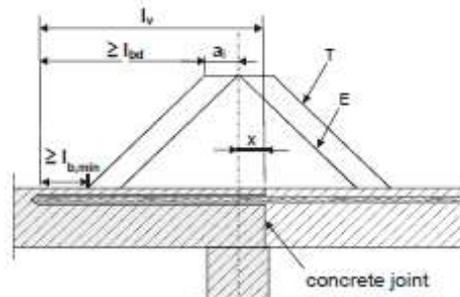

Figure 1.4 rebar connection for components stressed primarily in compression; rebar is stressed in compression

(only post-installed rebar is plotted)

Figure 1.5 Anchoring of reinforcement to cover the line of acting tensile force

Key to Figure 1.5

- T acting tensile force
- E envelope of $M_{ed}/z + N_{ed}$ (see EN 1992-1-1, Figure 9.2)
- x distance between the theoretical point of support and concrete joint

Note to Figure 1.1 to 1.5:

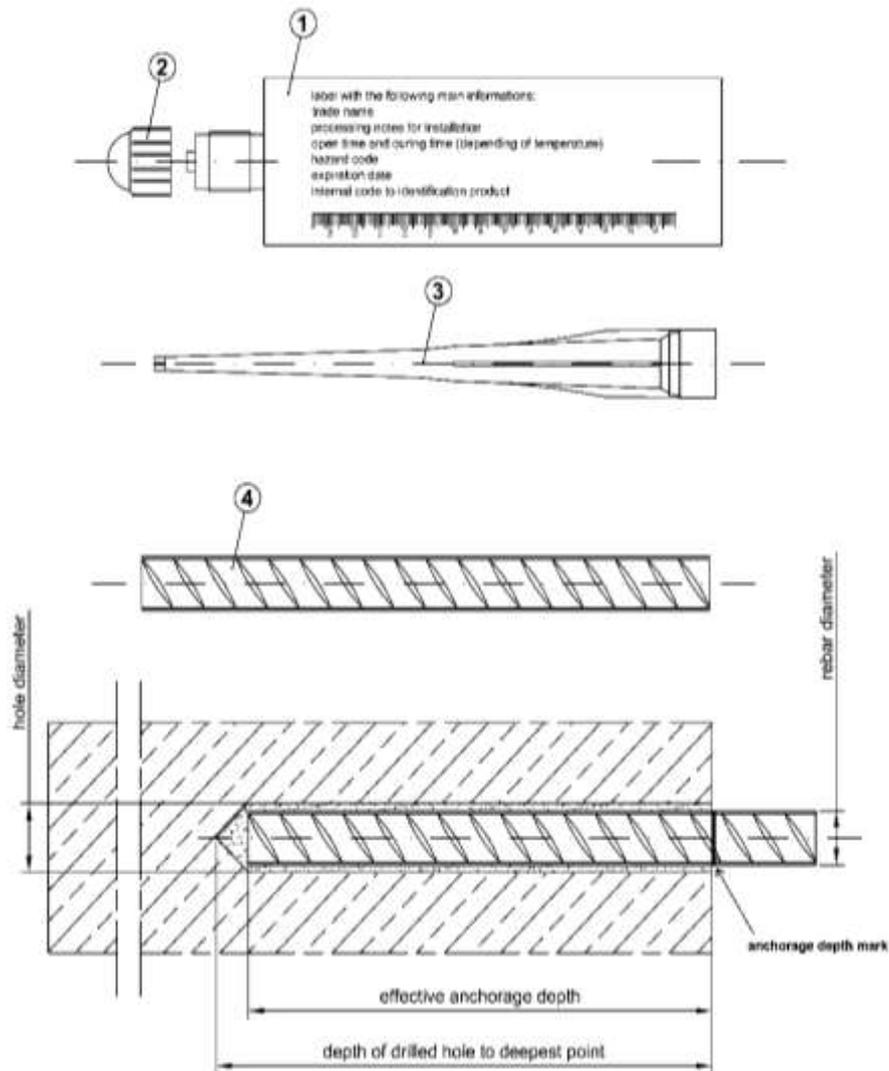

In the Figures no transverse reinforcement is plotted, the transverse reinforcement as required by EN 1992-1-1 shall be present.

The shear transfer between old and new concrete shall be designed according to EN 1992-1-1.

Annex A4
of European
Technical Assessment
ETA-14/0120

Specification of intended use**Anchorage subject to:**

- Static and quasi-static load: from Ø8 to Ø32 mm.
- Seismic load: from Ø12 to Ø32 mm.
- Fire exposure: from Ø8 to Ø32 mm.

Working life:

- Working life: 50 and/or 100 years.

Base material:

- Reinforced or unreinforced normal weight concrete of strength class C12/15 at minimum to C50/60 at maximum according to EN 206 for static and quasi-static load and for fire exposure.
- Reinforced or unreinforced normal weight concrete of strength class C16/20 at minimum to C50/60 at maximum according to EN 206 for seismic load.
- Maximum chloride content of 0,40% (Cl 0,40) related to the cement content according to EN 206.
- Non-carbonated concrete.

Note: In case of a carbonated surface of the existing concrete structure the carbonate layer shall be removed in the area of the post-installed rebar connection with a diameter of $d_s + 60$ mm prior to the installation of the new rebar. The depth of concrete to be removed shall correspond to at least the minimum concrete cover according to EN 1992-1-1:2004+AC:2010. The above may be neglected if building components are new and not carbonated and if building components are in dry conditions.

Temperature range:

The products may be used in the following temperature range:

- -40°C to $+80^{\circ}\text{C}$ (max. short term temperature $+80^{\circ}\text{C}$ and max. long term temperature $+50^{\circ}\text{C}$).

Temperature of the base material according to Annex B4.

Design:

- Anchorages are designed under the responsibility of an engineer experienced in anchorages and concrete work.
- Verifiable calculation notes and drawings are prepared taking into account of the forces to be transmitted.
- Design according to EN 1992-1-1:2004+AC:2010 for static and quasi-static condition (see also Annex B2).
- Design according to EN 1998-1:2004+AC:2009 for seismic condition (see also Annex B2).
- The actual position of the reinforcement in the existing structure shall be determined on the basis of the construction documentation and taken into account when designing.

Installation:

- Dry or wet concrete.
- It must not be installed in flooded holes.
- Overhead installation is permissible.
- Hole drilling by hammer drill (HD), hollow drill bit (HDB) or compressed air drill (CA).
- Installation of the post-installed rebar shall be done only by suitable trained installer and under supervision on the site.
- Check the position of the existing rebar (if the position of existing rebar is not known it shall be determined using a rebar detector suitable for this purpose as well as on the basis of the construction documentation and then marked on the building component for the overlap joint).

**Injection system VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T
for rebar connections**

**Intended use
Specifications**

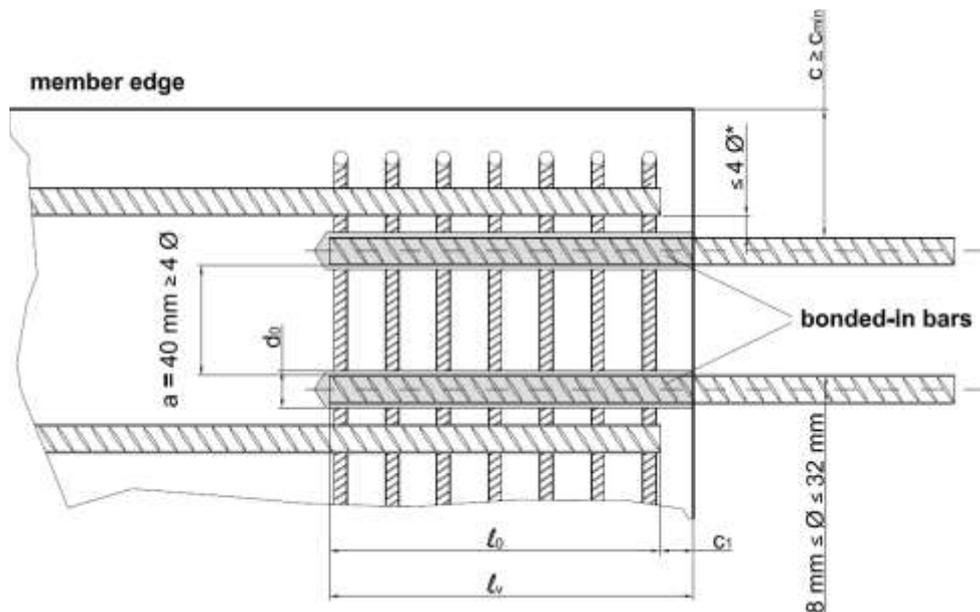

**Annex B1
of European
Technical Assessment
ETA-14/0120**

General design rules of construction for post-installed rebar

Post installed rebar may be designed for tension forces only.

The transfer of shear forces between new concrete and existing structure shall be designed additionally according to EN 1992-1-1:2004+AC:2010.

The joints for concreting must be roughened to at least such an extent that aggregate protrude.

* If the clear distance between overlapping rebar is greater than $4 \cdot \emptyset$ the overlap length shall be enlarged by the difference between the clear distance and $4 \cdot \emptyset$.

- l_0 lap length according to EN 1992-1-1:2004+AC:2010 for static and quasi-static loading or EN 1998-1:2004+AC:2009 for seismic loading
- l_v effective embedment depth; $l_v \geq l_0 + c_1$
- c concrete cover of post-installed rebar
- c_{min} minimum concrete cover according to Annex B3 and EN 1992-1-1:2004+AC:2010
- c_1 concrete cover at end-face of existing rebar
- d_0 nominal drill bit diameter according to Annex B3
- \emptyset rebar diameter (d_s)

**Injection system VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T
for rebar connections**

Intended use

Manual Blower pump: nominal dimensions

It is possible to use the mixer extension with the manual blower pump.

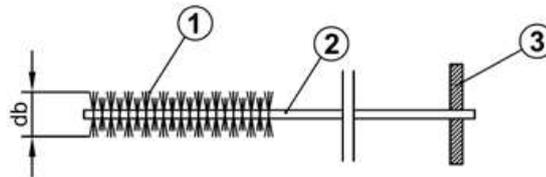

However it is possible to blow the hole using the mechanical air system (compressed air) also with the mixer extension

Suitable min pressure 6 bar at 6 m³/h
Oil-free compressed air
Recommended air gun with an orifice opening of minimum 3.5 mm in diameter

1) Position to insert the mixer extension

Mixer extension (from 380 mm to 1000 mm) with nominal diameter 8 or 10 mm

Installation with hollow drill bit (HDB)

This drilling method is a hammer drilling method.

This drilling system removes the dust and cleans the bore hole during the drilling operation when used in accordance with the user's manual.

This drilling system include a vacuum cleaner. A suitable dust extraction system must be used. e.g. Bosch GAS 35 M AFC or a comparable dust extraction system with equivalent performance data.

Switch-on the vacuum cleaner before to drill

Table B7: HDB installation diameters

Annex B7
of European
Technical Assessment
ETA-14/0120

Use the mixer extension (assembled on the standard mixer) for the injection up to 300 mm if necessary.

Use this system for special conditions.

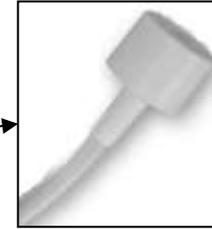

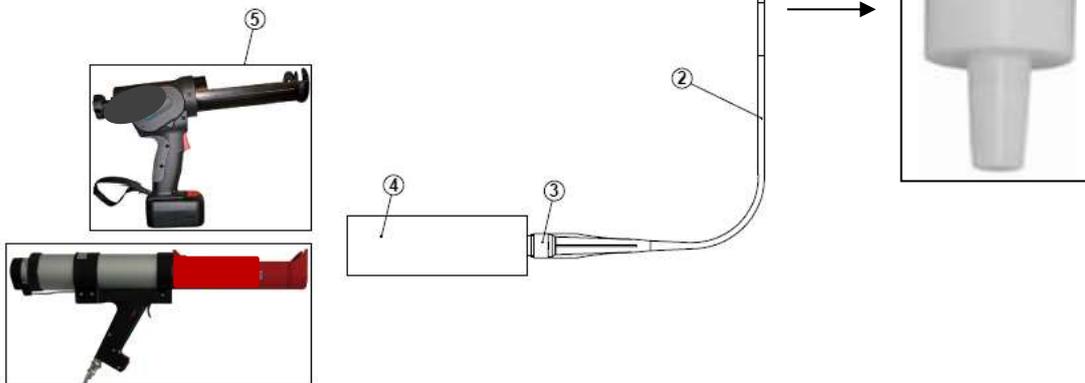

- ① Injection plug (nominal diameter according to the nominal diameter of drilled hole)
- ② Special mixer extension (variable length with external diameter 10 mm)
Mark the required mortar level ℓ_m and embedment depth ℓ_v with tape or marker on the injection extension. Quick estimation: $\ell_m = 1/3 \cdot \ell_v$
Continue injection until the mortar level mark ℓ_m becomes visible.
- ③ Mixer (suitable for all size of cartridge)

These tools allow the application in special conditions:
- installation with anchorage depth greater than 300 mm;
- overhead installation.

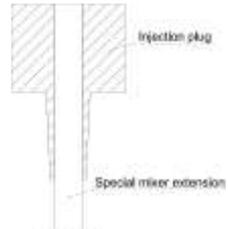

For these applications it is recommended the use of pneumatic or battery dispenser.

System assembled

- ① Injection plug
- ② Special mixer extension
- ③ Mixer
- ④ Cartridge
- ⑤ Sample of dispenser

Insert the special mixer extension in the inner diameter of the injection plug up to reach the top of the plug

Technical Assessment
ETA-14/0120

Minimum anchorage length and minimum lap length under static loading

The minimum anchorage length $l_{b,min}$ and the minimum lap length $l_{0,min}$ according to EN 1992-1-1:2004+AC:2010 shall be multiplied by the relevant amplification factor $\alpha_{lb,50y} = \alpha_{lb,100y}$ given in Table C1.

The design bond strength $f_{bd,PIR,50y} = f_{bd,PIR,100y}$ is given in Table C3. It is obtained by multiplying the bond strength f_{bd} according to EN 1992-1-1:2004+AC:2010 with the factor $k_{b,50y} = k_{b,100y}$ according to Table C2.

Table C1: Amplification factor $\alpha_{lb,50y} = \alpha_{lb,100y}$ related to the concrete class and drilling method

Concrete class	Drilling method	Bar size	Amplification factor $\alpha_{lb,50y} = \alpha_{lb,100y}$
C12/15 to C50/60	Hammer drilling (HD), hollow drill bit (HDB) and compressed air drill (CA)	8 mm to 32 mm	1,0

Table C2: Bond efficiency factor $k_{b,50y} = k_{b,100y}$ related to concrete class and drilling method for a working life of 50 and 100 years

$k_{b,50y} = k_{b,100y}$ for perforation with hammer drill (HD), hollow drill bit (HDB) and compressed air drill (CA)	Concrete class								
	C12/15	C16/20	C20/25	C25/30	C30/37	C35/45	C40/50	C45/55	C50/60

Design values of $f_{bd,PIR,50y} = f_{bd,PIR,100y}$

Annex C1
of European
Technical Assessment
ETA-14/0120

Minimum anchor length and minimum lap length under seismic loading

The minimum anchorage length $l_{b,min}$ and the minimum lap length $l_{0,min}$ according to EN 1992-1-1:2004+AC:2010 shall be multiplied by the relevant amplification factor $\alpha_{lb,seis,50y} = \alpha_{lb,seis,100y}$ given in Table C1.

The design bond strength $f_{bd,seis,50y} = f_{bd,seis,100y}$ is given in Table C5. It is obtained by multiplying the bond strength $f_{bd,PIR}$ according to EN 1992-1-1:2004+AC:2010 with the factor $k_{b,seis,50y} = k_{b,seis,100y}$ according to Table C4. The minimum concrete cover according to Annex B3 and $c_{min,seis} = 2 \varnothing$ applies.

Table C4: Amplification factor $\alpha_{lb,seis,50y} = \alpha_{lb,seis,100y}$ related to the concrete class for a working life of 50 and 100 years

Concrete class	Drilling method	Bar size	Amplification factor $\alpha_{lb,seis,50y} = \alpha_{lb,seis,100y}$

For all other bond conditions multiply the values by 0,7.

**Injection system VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T
for rebar connections**

Performances
Design values of $f_{bd,PIR,seis,50y} = f_{bd,PIR,seis,100y}$

Annex C2
of European
Technical Assessment
ETA-14/0120

Design value of the bond strength $f_{bd,fi,50y} = f_{bd,fi,100y}$ under fire exposure for concrete classes C12/15 to C50/60 (all drilling methods):

The design value of the bond strength $f_{bd,fi}$ under fire exposure has to be calculated by the following equation:

$$f_{bd,fi}(\theta) = k_{fi}(\theta) \cdot f_{bd,PIR} \cdot \frac{\gamma_c}{\gamma_{M,fi}}$$

If $21^\circ\text{C} \leq \theta \leq 271^\circ\text{C}$: $k_{fi}(\theta) = \frac{17,563 \cdot e^{-0,01\theta}}{f_{bd,PIR} \cdot 4,3} \leq 1,0$

If $\theta > 271^\circ\text{C}$: $k_{fi}(\theta) = 0$

$f_{bd,fi}(\theta)$ = Design value of the bond strength in case of fire exposure in N/mm²

(θ) = Temperature in °C in the mortar layer

$k_{fi}(\theta)$ = Reduction factor under fire exposure

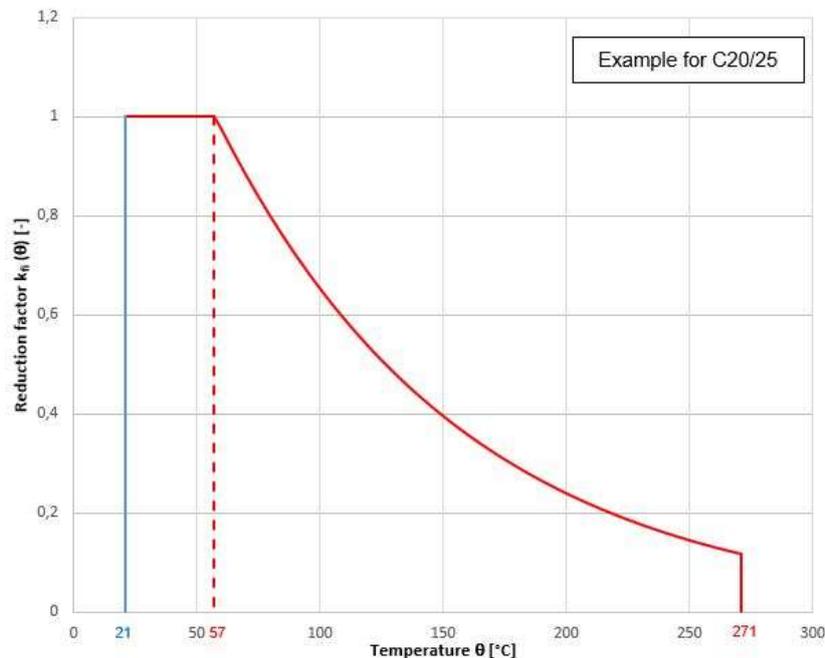

$f_{bd,PIR}$ = Design value of the bond strength in N/mm², according to Table C3 considering the concrete class, the rebar diameter, the drilling method and the bond conditions according to EN 1992-1-1:2004+AC:2010

γ_c = Partial safety factor according to EN 1992-1-1:2004+AC:2010

$\gamma_{M,fi}$ = Partial safety factor according to EN 1992-1-2:2004+AC:2008

For evidence under fire exposure the anchorage length shall be calculated according to EN 1992-1-1:2004+AC:2010, Equation 8.3 using the temperature-dependent ultimate bond strength $f_{bd,fi}$.

Figure C1: Example graph of reduction factor $k_{fi}(\theta)_{50y} = k_{fi}(\theta)_{100y}$ for concrete classes C20/25 for good bond conditions:

This European Technical Assessment contains

32 pages including 3 Annexes which form an integral part of this Assessment

This European Technical Assessment is issued in accordance with regulation (EU) No 305/2011, on the basis of

European Assessment Document (EAD)
330499-02-0601 "Bonded fasteners for use in concrete"

This version replaces

ETA-14/0119 issued on 07/10/2019

This European Technical Assessment is issued by the Technical Assessment Body in its official language. Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and shall be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full. However, partial reproduction may only be made with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

Specific Part

1 Technical description of the product

VI 100-PRO, VI 100-PRO-W and VI 100-PRO-T are bonded fasteners (injection type) consisting of an injection mortar cartridge using an applicator gun equipped with a special mixing nozzle and steel element: commercial threaded rod of the sizes M8 to M30 with hexagon nut and washer or reinforcing bar (rebar) Ø8 to Ø32 mm.

The steel element is placed into a drilled hole previously injected (using an applicator gun) with a mortar with a slow and slight twisting motion. The steel element is anchored by the bond between steel element, mortar and concrete.

An illustration and the description of the products are given in Annex A.

2 Specification of the intended use in accordance with the applicable European Assessment Document (EAD)

The performances given in clause 3 are only valid if the fasteners are used in compliance with the specifications and conditions given in Annex B.

The provisions made in this European Technical Assessment are based on an assumed working life of the fastener of 50 and/or 100 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

3.1 Performance of the product

3.1.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance to tension load and shear load (static and quasi static loading), displacements	See Annex C1 to C7
Characteristic resistance for seismic performance category C1	See Annex C8
Characteristic resistance for seismic performance category C2	See Annex C9

3.1.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Class A1
Resistance to fire	See Annex C10 to C12

3.2 Methods used for the assessment

The assessment has been made in accordance with EAD 330499-02-0601.

4 Assessment and verification of constancy of performance (AVCP) system applied, with reference to its legal base

According to Decision 96/582/EC of the European Commission the system 1 of assessment and verification of constancy of performance applies (see Annex V to regulation (EU) No 305/2011).

5 Technical details necessary for the implementation of the AVCP system, as provided in the applicable European Assessment Document (EAD)

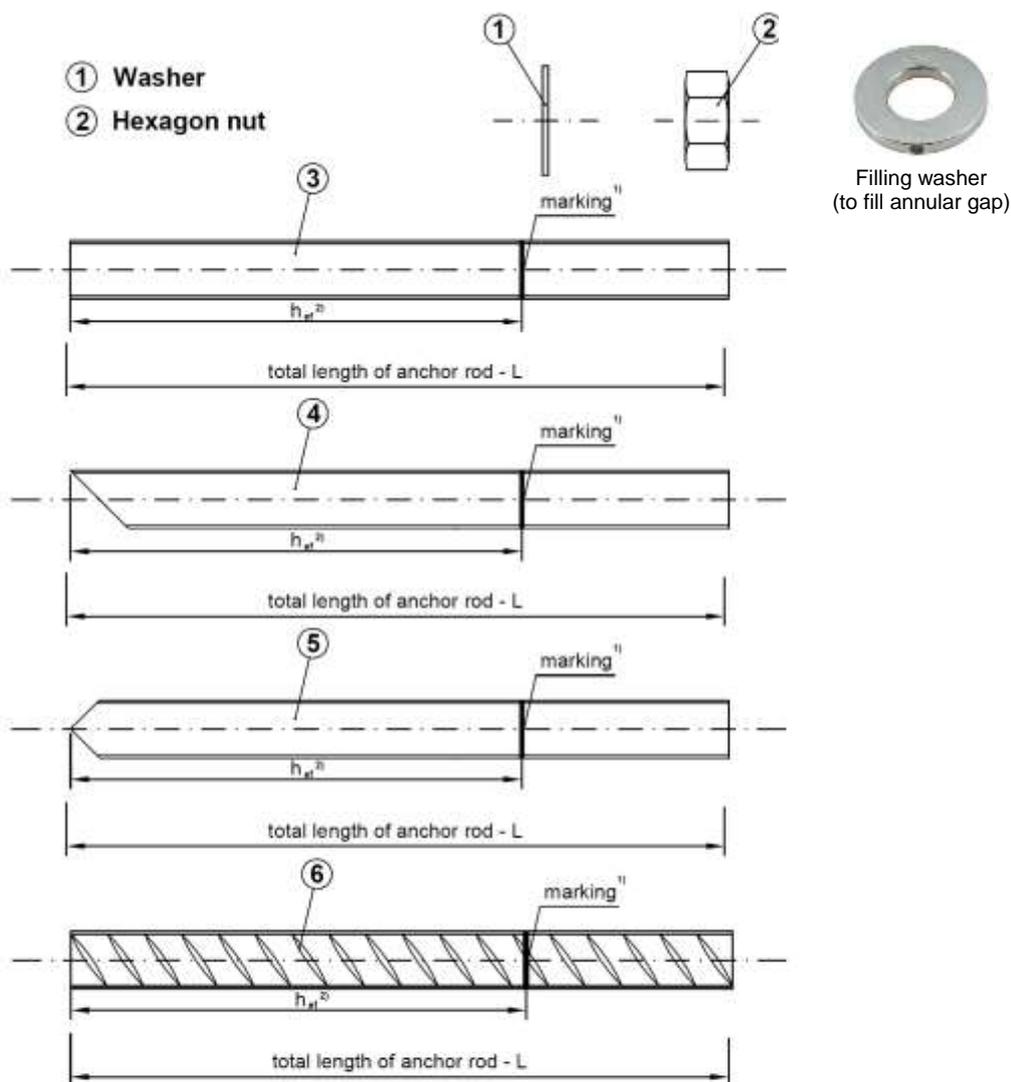

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited in Instytut Techniki Budowlanej.

For type testing the results of the tests performed as part of the assessment for the European Technical Assessment shall be used unless there are changes in the production line or plant. In such cases the necessary type testing has to be agreed between Instytut Techniki Budowlanej and the notified body.

Issued in Warsaw on 08/08/2024 by Instytut Techniki Budowlanej

Specifications of intended use

Anchors subject to:

- Static and quasi-static loads: sizes from M8 to M30 and from Ø8 to Ø32.
- Seismic performance category C1: sizes from M12 to M20, rods with $f_{uk} \leq 800 \text{ N/mm}^2$ and fracture elongation $A_5 \geq 19\%$.
- Seismic performance category C2: sizes M12 and M16, rods with $f_{uk} \leq 800 \text{ N/mm}^2$ and fracture elongation $A_5 \geq 19\%$.
- Fire exposure: sizes from M10 to M20, steel class 5.8 to 8.8 and stainless steel A4.

Working life:

Working life of the bonded fasteners of 50 and/or 100 years.

Base material:

- Reinforced or unreinforced normal weight concrete of strength class C20/25 at minimum to C50/60 at maximum according to EN 206.
- Uncracked concrete: sizes from M8 to M30 and from Ø8 to Ø32.
- Cracked concrete: sizes from M10 to M20.

Temperature range:

The anchors may be used in the following temperature range:

- -40°C to +40°C (max. short term temperature +40°C and max. long term temperature +24°C).
- -40°C to +80°C (max. short term temperature +80°C and max. long term temperature +50°C).
- -40°C to +120°C (max. short term temperature +120°C and max. long term temperature +72°C).

Use conditions (environmental conditions):

- Structures subject to dry internal conditions: all materials according to Table A1 and A2.
- For all other conditions according to EN 1993-1-4:2006+A1:2015 corresponding to corrosion resistance class:
 - stainless steel A2 according to Annex A2, Table A1 - CRC II,
 - stainless steel A4 according to Annex A2, Table A1 - CRC III,
 - high corrosion resistance steel (HCR) according to Annex A2, Table A1 - CRC V.

Installation:

- Dry or wet concrete (use category I1): sizes from M8 to M30 and from Ø8 to Ø32.
- Flooded holes with the exception of seawater (use category I2): sizes from M8 to M30 and from Ø8 to Ø32.
- Installation direction D3 (downward and horizontal and upwards installation): sizes from M8 to M30 and from Ø8 to Ø32.
- The anchors are suitable for hammer drilled holes (HD), for hollow drill bit (HDB) and for compressed air drill (CA): sizes from M8 to M30 and from Ø8 to Ø32.

Design methods:

- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings (e. g. position of the anchor relative to reinforcement or to supports, etc.).
- Anchorages are designed under the responsibility of an engineer experienced in anchorages and concrete work.
- Anchorages under static or quasi-static loads are designed according to EN 1992-4 and EOTA Technical Report TR 055.
- Anchorages under seismic actions are designed according to EN 1992-4.
- Anchorages under fire exposure are designed according to EOTA Technical Report TR 082.

Hollow Drill Bit (HDB)

This drilling method is a hammer drilling method.

This drilling system removes the dust and cleans the bore hole during the drilling operation when used in accordance with the user's manual.

This drilling system include a vacuum cleaner. A suitable dust extraction system must be used. e.g. Bosch GAS 35 M AFC or a comparable dust extraction system with equivalent performance data.

Switch-on the vacuum cleaner before to drill

Use the mixer extension (assembled on the standard mixer) for the injection up to 300 mm if necessary.

Use this system for special conditions.

Insert the special mixer extension in the inner diameter of the injection plug up to reach the top of the plug

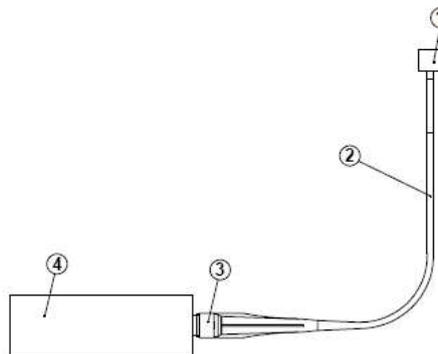

- ① Injection plug (nominal diameter according to the nominal diameter of drilled hole)
- ② Special mixer extension (variable length with external diameter 10 mm)
Mark the required mortar level ℓ_m and embedment depth ℓ_v with tape or marker on the injection extension. Quick estimation: $\ell_m = 1/3 \cdot \ell_v$
Continue injection until the mortar level mark ℓ_m becomes visible.
- ③ Mixer (suitable for all size of cartridge)

These tools allow the application in special conditions:
- installation with anchorage depth greater than 300 mm;
- overhead installation.

For these applications it is recommended the use of pneumatic or battery dispenser.

System assembled

- ① Injection plug
- ② Special mixer extension
- ③ Mixer
- ④ Cartridge
- ⑤ Sample of dispenser

1		<p>Drill the hole with the correct diameter and depth using a rotary percussive machine. Check the perpendicularity of the hole during the drilling operation. In case of use of hollow drill bit (Annex B7) proceed directly to the clause 3.</p>
2	<p>4x blower manual pump 4x standard brush 4x blower manual pump if necessary use a mixer extension for the blower operation (see Annex B5)</p>	<p>Clean the hole from drilling dust: the hole shall be cleaned by at least 4 blowing operations, by at least 4 brushing operations followed again by at least 4 blowing operations; before brushing clean the brush and check (see Annex B6, standard brush) if the brush diameter is sufficient. For the blower tools see Annex B5.</p>
3		<p>For coaxial, peeler and side by side cartridges unscrew the front cup, screw on the mixer and insert the cartridge into the gun. For CIC sizes, unscrew the front cup, pull-out the steel closing clip according to the following operation:</p> <ol style="list-style-type: none"> 1) Insert the mixer in the eye of the plastic extractor; 2) Pull the extractor to unhook the steel closing clip of the foil. In the version without the extractor cut the foil pack. <p>After that screw on the mixer and insert the cartridge in the gun.</p>
4		<p>Before starting to use the cartridge, eject a first part of the product, being sure that the two components are completely mixed. The complete mixing is reached only after that the product, obtained by mixing the two components, comes out from the mixer with a uniform colour.</p>
5	<p>if necessary, use a mixer extension for the injection (see Annex B8)</p>	<p>Fill the drilled hole uniformly starting from the drilled hole bottom, in order to avoid entrapment of the air; remove the mixer slowly bit by bit during pressing-out; filling the drill hole with a quantity of the injection mortar corresponding to 2/3 of the drill hole depth.</p>
6	<p>ATTENTION: Steel elements dry and free oil and other contaminants</p>	<p>Insert immediately the steel element (threaded rod or rebar), marked according to the proper anchorage depth, slowly and with a slight twisting motion, removing excess of injection mortar around the steel element. Observe the processing time according Annex B4. Wait the curing time according Annex B4.</p>
<p>VI 100-PRO VI 100-PRO-W VI 100-PRO-T</p>		<p>Annex B10 of European Technical Assessment ETA-14/0119</p>
<p>Intended use Installation instruction up to 300 mm depth</p>		

1	<p>See clause 1 Annex B10. In case of use of hollow drill bit (HDB) proceed directly to the clause 3.</p>	
2	<p>4 x 5 seconds 4x 4 x 5 seconds</p> <p>ATTENTION: compressed air free oil</p>	<p>Clean the hole from drilling dust:</p> <p>the hole shall be cleaned by at least 4 blowing operations (5 seconds for single operation) with compressed air, by at least 4 brushing operations with special brush followed again by at least 4 blowing operations (5 seconds for single operation) with compressed air. Before brushing clean the brush and check if the brush diameter is sufficient.</p>
3	<p>See clause 3 Annex B10</p>	
4	<p>See clause 4 Annex B10</p>	
5		<p>Before starting the injection, assemble the system according to Annex B8. After that, fill the drilled hole uniformly from the drilled hole bottom, in order to avoid entrapment of the air; remove the special mixer extension with injection plug slowly bit by bit during pressing-out; filling the drill hole with a quantity of the injection mortar corresponding to 2/3 of the drill hole depth.</p> <p>Procedure for overhead installation are detailed in Annex B12.</p>
6	<p>See clause 6 Annex B10</p>	
<p>VI 100-PRO VI 100-PRO-W VI 100-PRO-T</p>		<p>Annex B11 of European Technical Assessment ETA-14/0119</p>
<p>Intended use Installation instruction up to 640 mm depth</p>		

Overhead installation procedure

In addition to standard procedure, for overhead installation, following the below procedure

<p>①</p> 	<p>1 - Start Injection</p> <p>Inject from the bottom of the hole. Use battery or pneumatic dispenser if the anchorage depth is greater than 200 mm.</p>
<p>②</p> 	<p>2 - Injection phase</p> <p>Inject the product about 2/3 of the hole depth. Remove the mixer extension slowly bit by bit during pressing-out.</p>
<p>③</p> 	<p>3 - End injection</p> <p>Remove the mixer extension. Insert immediately the steel element (turn the steel element during the insertion).</p>
<p>④</p> 	<p>4 - End installation</p> <p>To avoid the slipping of the steel element during the open time of the product (due to the steel element own weight) use a temporary interlocking element (for ex. wedge of wood)</p>

Characteristic bond resistance of a single bonded fastener $\tau_{Rk,fi,p}(\theta)$ for concrete strength classes C20/25 to C50/60 with all drilling methods under fire conditions for working life of 50 and 100 years.

The characteristic bond resistance of a single bonded fastener under fire conditions $\tau_{Rk,fi,p}$ for a given temperature (θ) shall be calculated using the following equations:

$$\tau_{Rk,fi,p}(\theta) = k_{fi,p}(\theta) * \tau_{Rk,cr,C20/25}$$

$$\tau_{Rk,fi,p}(\theta) = k_{fi,p}(\theta) * \tau_{Rk,cr,100,C20/25}$$

Where:

$$\text{if } \theta \leq \theta_{max} \quad k_{fi,p}(\theta) = k_{fi,p}(\theta) = 0,8049 \cdot e^{-0,0097 \cdot \theta} \leq 1,0$$

$$\text{if } \theta > \theta_{max} \quad k_{fi,p}(\theta) = k_{fi,p}(\theta) = 0$$

$\theta_{max} = 271^\circ\text{C}$

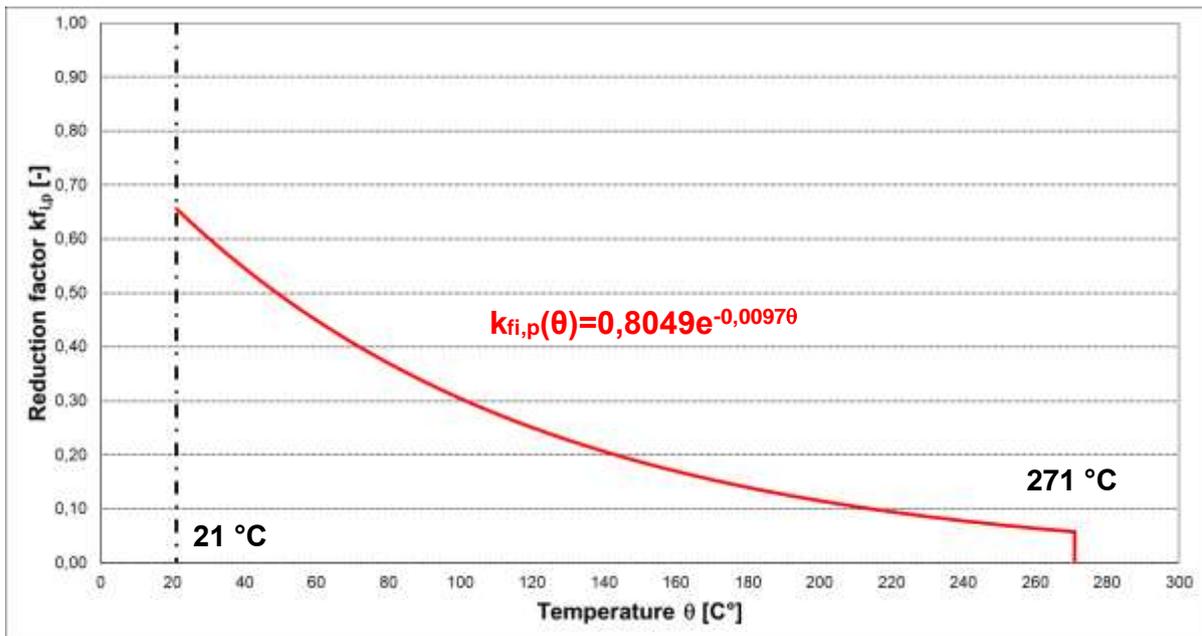

$\tau_{Rk,fi,p}$ = characteristic bond resistance for cracked concrete under fire exposure for a given temperature (θ)

$k_{fi,p}(\theta)$ = reduction factor for bond resistance under fire exposure

$\tau_{Rk,cr,C20/25}$ = characteristic bond resistance for cracked concrete for concrete strength class C20/25 for a working life of 50 years given in Table C3.

$\tau_{Rk,cr,100,C20/25}$ = characteristic bond resistance for cracked concrete for concrete strength class C20/25 for a working life of 100 years given in Table C3.
